

## Phase 6 - System Security Centre

### System Security Centre - Deferred Implementation Plan

You correctly identified the importance of a security assurance component on the platform. However, in order to avoid scope creep, it is recommended to defer implementation until the platform is more mature.

Decision: Postpone implementation of the Security Centre to Phase 6.

#### Why Defer?

1. Scope Containment - Introducing security logic now could disrupt current development.
2. Dependency on Maturity - Security assurance should rely on completed user/org roles, stable logging, and a functioning upload pipeline.
3. No Blocking Risk - This module can be added as a bolt-on once core infrastructure is in place.
4. Controlled Scope = Higher Quality - Implementing it later will result in a cleaner, better integrated module.

#### Saved Action Plan:

Phase 6 - System Security Centre (Future Module)

Status: Parked for post-Phase 5 implementation

Trigger: Begin onboarding clients or exposing platform externally

#### Planned Features:

- Transparent platform security dashboard
- Live activity/audit logging for file access
- Download request dual-authorization capability
- Real-time breach alerting to orgs and users

## **Phase 6 - System Security Centre**

- Quick "Scan" button for security thumbs up/down
- Maturion explanation capability: explain architecture, controls, encryption, and allow printable version

This note has been saved in long-term memory for future planning.
